Hemolysis occurs normally in a small percentage of red blood cells as a means of removing aged cells from the bloodstream and freeing heme for iron recycling. It also can be induced by exercise. In disease, hemolysis typically is associated with hemolytic anemia, whereby increased or accelerated hemolysis shortens the life span of red blood cells, causing them to die more quickly than they can ...

The importance of the gut-brain axis in maintaining homeostasis has long been appreciated. However, the past 15 yr have seen the emergence of the microbiota (the trillions of microorganisms within and on our bodies) as one of the key regulators of gut-brain function and has led to the appreciation of the importance of a distinct microbiota-gut-brain axis.
